User guide

Everything you can do with the journal, step by step. The ‘How does this work?’ button in the app shows the same explanation.

dcramere-journal.vercel.app

CONTENTS

1. Quick start
2. Logging a trade (+ Trade)
3. Emotion and notes
4. Import and accounts
5. Journal tab
6. Trades tab
7. Stats tab
8. Report tab
9. Filters and units
10. Your account, privacy and data

1. Quick start

1. **Create an account** (or log in). Without logging in, everything stays in this browser only.

2. Open the **Import** tab: adjust your account (name, **starting balance**, **planned risk per trade**) and drop your Tradovate export in the box. Or log trades yourself with **+ Trade** top right.

3. Tick your **emotion** on every trade, and write a short **lesson** when there is something to learn.

4. Check your numbers in **Journal**, patterns in **Stats** and what is going well and what can improve in **Report**.

2. Logging a trade (+ Trade)

- **Account, date, open and close time**: the times are optional. The time zone is in your journal settings and decides which day, hour and weekday the trade falls on.
- **Direction**: Long or Short. **Symbol**: for example MNQ or ES. **Number of contracts**: 1 by default.
- **Entry and exit** are optional. Fill them in for a known contract (MNQ, MES, NQ, ES, YM, RTY, CL, GC and more) and **the app calculates the result itself**, commission included. Leave the result empty for that.
- **Result in $ (net)** or **in R**: fill in one. With only R, the app converts it to dollars using your planned risk.
- **Costs**: leaving it empty uses your account's commission.
- **Setup**: choose which setup you traded. That feeds the breakdown by setup.
- **Screenshot**: add an image of your chart. It is shrunk automatically.

3. Emotion and notes

- Before the trade, choose how you feel: **Calm, Confident, Unsure, Impatient, Frustrated** or **Revenge-driven**. Tap your choice again to clear it.
- In the **Mistake / lesson** field you write what went well or what you learn from it.
- You can add it afterwards: **Trades** › click a trade › **Edit**. Imported trades have no emotion; add it that way.

- You see it again in **Journal** (Emotion & result), in **Stats** (By emotional state) and in your **Report**. The more often you fill it in, the more reliable the patterns.

4. Import and accounts

- **Import a Tradovate export**: drop a CSV (Performance or Orders) on an account or choose **Choose a file**. Set the file's time zone correctly. Trades you already had are skipped. This journal's own CSV export is recognised too.
- **Orders** are merged per position: several fills become one trade.
- **New account**: for a live, prop, paper or backtest account, each with its own starting balance and risk.
- **Settings** per account: name, broker, starting balance, commission per contract, type, **planned risk per trade** (in % or $) and the risk mode **Fixed risk** or **Compounding** (risk grows with your balance).
- **Deposits and withdrawals** count toward your balance, but not as profit or loss.
- **Delete account**: the trash can top right on the card. **Clean up empty accounts** removes all accounts without trades at once. Deleting cannot be undone.
- **Backup and restore** (at the bottom): download everything as JSON, screenshots included, and restore it later or on another device.

5. Journal tab

- **Key figures**: balance and result, win %, average win against average loss, profit factor, expectancy and average R.
- **Year overview and month calendar**: every day in green or red. Switch with the buttons between **P&L, Trades, Win % and Avg W/L**. Click a day to see its trades.
- **Recent trades** and **Emotion & result** (average result per emotion).
- **Charts**: win %, win-to-loss ratio, expectancy, drawdown (how far under your high you were), position size, net daily result, result by hold time and time of day, and your cumulative result. Hover or tap a chart for the values.
- **The question mark** next to a key figure explains what the number means, using your own amounts. The colour follows your overall result.
- **News**: a gold dot in the calendar means US news is scheduled that day (CPI, jobs report, Fed decision and more). Hover over the day for its name. The **News ahead** card shows the next 7 days, times in New York.
- **Customize your dashboard**: choose **Arrange / add widgets** above the key figures. Move widgets with the arrows, hide what you do not need, bring it back with the plus, and **save your layout under a name**. Then switch between your layouts with one click. This applies to your own browser only.

6. Trades tab

- All trades by day, with the result per day. **Click a trade** for details, your lesson and your screenshot.
- Click a trade to also see **entry and exit, times, duration and fills**. A trade held over several days shows **'days later'**.
- **Edit** and **Delete** are in a trade's details.
- **Filter these trades**: search by symbol or note, or filter by direction, outcome, setup or emotion. Picking a day in the calendar filters too. **Clear filters** resets everything.
- **Download CSV** (at the bottom) saves all your trades as a spreadsheet.

7. Stats tab

- **The year at a glance**, cumulative result, account balance and drawdown.
- **Streaks**: your longest winning and losing runs.
- **Your statistics**: result, days, the trades themselves, months, streaks and drawdown in one overview.

- **Breakdowns** by weekday, hour, contract, direction, emotion and setup. Switch the view between **Win %, Net, Avg win, Avg loss, Avg duration** and **Summary**.
- On **Stats** too you can move, hide and add cards with **Arrange / add widgets**. Journal and Stats each remember their own layouts.
- **On news days**: how your trades turn out on days with scheduled news, per type of release.
- **Time to target** and **Effective growth rate**: when you reach a dollar target if your pace stays the same. It is a hypothesis, not a forecast.
- **Monte Carlo, Risk of ruin** and **Kelly criterion** only appear from 100 trades. Before that the sample is too small to say anything.

8. Report tab

- For every completed week and month the app automatically makes a report from your trades, using fixed rules (no AI).
- You see an **opening line** with your result, **What is going well**, **Where you can improve** and one **focus** for the coming period.
- It looks at your best and worst emotion, setup, weekday and hour, outlier losses, inconsistent position size, sizing up after a loss, too many trades in a day and losing streaks.
- **Copy as text** or **Share via WhatsApp** passes the report on. Switch at the top between **Weekly** and **Monthly** and choose an earlier period.
- A report only appears once the week or month is over and you logged trades in it.

9. Filters and units

- At the top of Journal, Trades and Stats you choose the **period** (all time, 7 or 30 days, this or last month, this year) and the **account**.
- The **$ / % / R** switch changes every number and chart: dollars, percent of your account or R multiples of your planned risk.
- **R** is your result divided by your planned risk per trade. **%** is your result divided by your starting balance (with Compounding: your current balance).
- Top right you switch between **NL and EN**. The language is remembered.

10. Your account, privacy and data

- You can **log in** on any device; your data then lives in your account. Without an account everything stays in this browser only, so make a backup regularly.
- **Lost your password?** Use 'Forgot your password?' on the login screen if it is there, or ask your coach for a reset link. With the link you choose a new password; you are logged out everywhere.
- **Privacy**: your coach can only read your journal, not change it. Under **Import › Privacy and account** you see when your coach looked or created a reset link.
- **Delete account**: the same card. That permanently erases your account and all your trades, screenshots and reports.
- If you already had a local journal in this browser, the app offers to move it into your account after logging in.
